

Claims

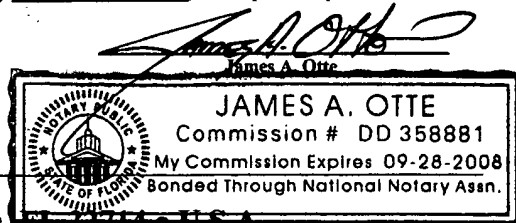

- 1) This invention is comprised of a tongued – and - grooved tile made of cement which contains a metal framework made of corrugated thin rods in the form of a square or frame which in turn contains inside a chicken wire lattice taut and secured on the four sides of the frame, above the frame it has an extension that helps the metal plates to attain a flat – formed surface being level with the interior surface of the tile. Subsequently, these tiles can be fitted to the structure through angles that can be welded or bolted.
- 2) According to claim 1, the invention possesses the feature of being a tongued – and - grooved tile, this allows the tiles to be joined to form a surface.
- 3) According to claim 1, the invention possesses the feature of having a metal framework made of corrugated thin rods, in the shape of a frame or square which, in turn, contains a metal lattice inside.
- 4) According to claim 1, the invention possesses the feature of having several extensions in the frame, which project to the surface of the cement.
- 5) According to claim 4, the invention possesses the feature that on the tongued – and – grooved surface it can be joined to a metal frame through angles that can be welded or bolted.
